

Team Nexo

Practice depends on feasible supply arrangements

“Take the questions with you. This material brings together the concepts and the case so you can continue the discussion after the game.” — Iris

The problem we investigated

In the surgical ward, two of four eligible care teams started the protocol. Supply is irregular, and collecting materials takes time. Larger stock resolves part of the problem but may increase waste and costs.

Mission objectives

- Distinguish initial adoption from day-to-day delivery
- Negotiate a strategy compatible with resources and workflow
- Assess adoption, feasibility and implementation cost

Initial fictional case data

Measure	Data	What it represents
Teams that started	2/4	Eligible teams; initial use, rather than sustained delivery
Incomplete supply	3/10 days	Days in the observation period when at least one required material was missing
Collecting materials	14 min	Median time per collection across the 12 observed collections
Additional pilot cost	R\$ 480	Initial fictional estimate; staff time and waste are not yet included

Educational simulation. Fictional data, patients and characters. Framework applications are educational interpretations, rather than clinical recommendations or a validated instrument.

From knowledge to change

Knowledge-to-Action

KTA connects knowledge creation with an action cycle. Identifying the gap, adapting to context, investigating barriers, selecting strategies, monitoring, evaluating and sustaining are activities that can be revisited.

In your case: Investigating demand and replenishment allows the pilot to fit actual resources.

Avoid: Treating the cycle as a rigid checklist or assuming that publishing the protocol completes implementation.

Updated CFIR

CFIR organizes determinants into five domains. It supports investigation of barriers and facilitators; it does not automatically select a strategy or replace outcome evaluation.

Domains: innovation; outer setting; inner setting; individuals; process.

In your case: Creating stock is a strategy; resource shortages and inadequate workflow are possible determinants.

Avoid: Confusing a barrier with the strategy to address it, or classifying an account without defining the project's context.

PARIHS and i-PARIHS

PARIHS emphasizes evidence, context and facilitation. i-PARIHS connects innovation, recipients and context through active facilitation: assessing needs, aligning conditions and supporting change.

Facilitation requires action: assessing needs, negotiating conditions, preparing people and monitoring implementation. Appointing someone is not the same as facilitating.

In your case: Supporting negotiation among supply staff, recipients and leadership connects conditions with practice.

Avoid: Appointing a facilitator and assuming that the title, without action and support, resolves implementation.

Planning and evaluating with RE-AIM

RE-AIM supports planning and evaluation at individual and organizational levels. Define the unit of analysis, numerator, denominator, source and time point; also investigate representativeness.

Dimension	Study question
Reach	Participation and characteristics of intended recipients.
Effectiveness	Effects of the intervention, including unintended effects.
Adoption	Participation of settings and staff who initiate the practice.
Implementation	Delivery, adaptations and costs.
Maintenance	Continuity at individual and organizational levels.

Application to the mission

Simulated adoption: 3/4 teams = 75%. Investigate who started and who was left out. The measure does not establish consistent delivery. The observed R\$ 720 includes materials, staff time and waste; specify the composition of the initial estimate.

Indicator worksheet

Record: dimension or outcome; unit of analysis; numerator; denominator; source; time point; responsible person; criterion for reviewing the plan. Analyze who was left out and unintended effects.

Using an overall rate to hide groups not reached, or confusing initial adoption with continuity.

Source: Glasgow et al., 2019. Definitions cover individual and organizational levels; measures depend on the project.

Implementation outcomes

Proctor's taxonomy distinguishes implementation outcomes from service and clinical outcomes. Each measure must specify what is assessed, by whom, at which level and time point.

Outcome	What to investigate
Acceptability	Perception that the practice is satisfactory.
Adoption	Intention, initial decision or initiation of use.
Appropriateness	Perceived relevance and compatibility.
Feasibility	Possibility of delivering the practice in the context.
Fidelity	Delivery as intended.
Cost	Financial impact of implementation.
Penetration	Integration within services and subsystems.
Sustainability	Maintenance or institutionalization.

Your team's study priority

Feasibility: compare accounts with collection time, shortages and delivery under different levels of demand. Cost: specify the period, perspective and incremental implementation resources, including time and waste; do not include all usual care costs.

Distinguish the measures

Clinical outcome: change in health status, such as pressure injury occurrence. Service outcome: quality or functioning of care. Implementation outcome: embedding the practice. These may be related, but one does not establish the others or, by itself, causality.

Revisit the discussion

The context changed

The institution will not approve additional hiring this month. The pilot budget remains R\$ 480 and must include waste and staff time.

Questions to review your reasoning

- Does the plan distinguish initial adoption from delivery?
- Does facilitation include leadership, supply staff and the night shift?
- Does the feasibility and cost assessment consider demand, time and waste?
- Which data supported the choice? Which new evidence would make you revise the plan?
- Did you distinguish determinant, strategy and outcome? Describe an example from the mission.
- How did you preserve core components and adapt workflow to context?

Notes after the discussion

Record the selected strategy, a limitation raised in discussion, a complete indicator and the next step. Also revisit facilitator feedback in the game journal.

This guide presents the case and concepts; it does not automatically reproduce decisions or feedback entered in the game.

My next step: _____

Evidence I still need: _____

Indicator and review criterion: _____
